

Personal Expense Tracker in Python

The **Personal Expense Tracker** is a Python-based project that enables users to manage their daily expenses and track their spending against a monthly budget. Users can log expenses with details like the date, category, amount, and description. The tracker categorizes these expenses and allows users to view their expense history. Additionally, users can set a monthly budget, and the tracker will compare it with total spending, providing warnings if the budget is exceeded. The program supports file handling to save and load expenses in CSV format, ensuring that users can continue tracking from where they left off. An interactive menu allows users to add expenses, view expenses, track the budget, save data, and exit the program easily.
